Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(GENE-) GENE LOGIC INC.

Vockley J; Yamaga S, Weissman SM, Beazer-Barclay Y,

WPI; 2002-435328/46.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.

claim 1; SEQ ID NO 1043; 114pp; English.

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (Gs) identified by DNA chip analysis a sgiven in the specification, and comparing the expression level to an expression level in an unactivated GC, where differential expression of Gs is indicative of GCA. Also included are

us-09-975-856-1.rng

```
capable of adulating Mes. So not contain an agent that are are the agent and are are the agent capable of adulating GCA or an inflammation (especially chronic) in a tissue, an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (MA) an inflammation (especially chronic) in a profile; (3) detecting (MA) an inflammation (especially chronic) in a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation; (4) treating (MS) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene (s) from Gs in the tissue. MI consistent that modulates the expression of gene (s) from Gs in the tissue. MI consistent in a utissue, M4 is useful for detecting an agent capable of modulating GA preferably in an inflammation in a tissue, an allergic response in a subject, or exposure of a subject to a pathogen or sterile inflammatory disease (e.g. profiles experies); the an allergic response in a subject, or exposure of a subject to a pathogen or sterile inflammatory disease (e.g. profiles experies); theumatoid arthritis, glomerulonephitis, asthma, thrombosis, cardiac reperfusion injury, renal reperfusion injury, renal reperfusion injury, renal reperfusion injury, renal reperfusion injury, and response in a contacting a crepitatory distares, spridtent inflammatory disease, contacting a crepitation in a contacting an inflammatory disease, contacting a crepitation injury, renal reperfusion injury, and in the contacting an inflammatory disease, contacting a contacting a contacting an inflammatory disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             420

The present invention describes an isolated epitope (1) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (1). (1) has cytostatic activity. VC is useful for treating an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HiA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (1) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis limiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PCR). ABQ33843 to ABQ33858 and ABP74128 to ABP747;3 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemotherapy. blochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MHC -peptide complexes of the invention are useful for determining specific T call frequency. This method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunisation step. Compositions of the invention are useful for diagnosing a disease. The current sequence represents an epitope of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence of a newly isolated human SSX4 cDNA clone. The CDNA was isolated from a human testicular cDNA by PCR amplification using primers (see AAV7006-63) based on the known SSX2 sequence. A SSX5 clone (see AAV70061) was also obtained. 2 Forms of SSX4 were identified. One of these lacked nucleotides 331-466 but was otherwise identical to the present SSX4 sequence and is described as an alternatively spliced form. SSX4 shares 89.4% homology to SSX1 on the nucleotide level and 79.3% at the amino acid level. The inventional additionally provides expression vectors, transformed or transfected cells that can be used to produce SSX proteins, and primers (see AAV70062-73) useful for determining expression of an SSX gene in a sample. The

                the translocation t(X;18) (p11.2;q11.2) found in human synovial sarcomas, involving joining of the SYT gene (AAT11778) on chromosome-18 at 18q11.2 to SSX2. The gene fusion is then transcribed to produce an SYT-SSX2 (AAT11781) fusion transcript and translated into a fusion protein. SSX2 may be distinguished from related sequence SSX1 (AAT11779) by digestion with Smal and Lept. Primer AAT11784 has been used in polymerase chain reaction amplification of SSX2 sequences. Detection of the gene or its product in an abnormal location or as a fusion may be used in diagnosis
                                                                                                                                                                            of synovial sarcoma, using primers, probes, humanised antibodies, monoclonal antibodies, etc. Antisense oligonucleotides and antibodies also be used therapeutically, and antitumour recombinant vaccines may

The method is useful for diagnosing, determining onset, progression, or regression of colon cancer in a subject, or for selecting a course of treatment of a subject having or suspected of having colon cancer. The colon cancer associated polypeptides are useful as markers for diagnosing colon cancer, and for following the course of treatment of colon cancer. The present sequence is human colon cancer-associated polypeptide gene

The present invention describes an isolated epitope (I) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for reating an animal, by administering to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunotherapeutic composition. VC is also useful for evaluating immunotenicity of a vaccine or immunotherapeutic composition, by administering VC to an HLA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis, climiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PCR). ABQ83843 to ABQ83858 and ABP74128 to ABP74131 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       420

Epitope having high affinity for major histocompatibility complex class I useful for treating an animal, evaluating immunogenicity of a vaccine or therapeutic composition and for diagnosing a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated epitope polypeptide that has high effinity for major histocompatibility complex (MHC) class I, and an epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, chemcherapy or biochemotherapy or surgery. The composition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MHC repeptide complexes of the invention are useful for determining specific T cell frequency. This method is useful for evaluating immunological response, by performing the method prior to and subsequent to an immunisation step. Compositions of the invention are useful for disease. The current sequence represents an epitope of the

Novel method of serological fishing - allows isolation of molecule antigens) associated with pathological conditions, e.g. Hodgkin's disease, cancer or auto:immune disease. Claim 31; Page 29; 44pp; English WPI; 1997-051896/05

designated HOM-MEL 40. It was isolated using a novel method in which a designated HOM-MEL 40. It was isolated using a novel method in which a cDNA library prepd. from malignant melanoma and expressed in B. coli colls. Lysates of the host cells and with sera that had been treated to remove interfering binding partners. This involved contacting the sample with lysates of untransfected host cells and with host cells transformed with the same vector (phage lambda) used to make the CDNA library. The method, termed serological fishing, can be used to detect antigens in human tissues, esp. tumour cells, which are useful in the moliganosis of diseases and/or for immunotherapy and gene therapy of infectious, autoimmune and malignant diseases (see also AAA-4747-49). HOM-MEL 40 is expressed in 50% of melanomas, 20% of prostate cancers, 20% of gastric cancers, 20% of colorectal cancers, 12% of lung cancers and calls present a nonomer (see also AAW-09449- 52) derived from HOM-MEL, suggesting that HOM-MEL 40-specific vaccines, useful in inducing T lymphocytes, are possible

Clone HOM-MEL-40 was isolated from a human malignant melanoma oDNA clonery using a method, designated serological fishing, designed to identify immunoreactive markers of disease. In this method, cells characteristic of a disease are used to prepare a cDNA library for transformation of eukaryotic or prokaryotic cells, and the cells grown to express proteins. Patient serum is incubated with the cells used to prepare the library, but not transfected, to remove any components of the cells carrying the empty vector. The twice-stripped sample is similarly treated incubated with lysate of the library cells, so that specific components in the sample may bind to the expression protein. Proteins that form the sample may bind to the expression protein. Proteins that form melanoma, but not healthy tissues. The deduced amino acid sequence melanoma associated antigen is strongly expressed in melanoma, but not healthy tissues. The deduced amino acid sequence includes 1 tumour-associated peptides (see AAW41587-89) that bind to HIA-marker (see AAV04262) of Hodgkin's disease Nucleic acid and derived protein are markers for Hodgkin's disease - used in identifying immuno:reactive markers of disease. 1 ATGAACGGAGACGACGCCTTTGCAAGGAGACCCAGGGATGATGTCCAAATATCAGAGAAG 99 ATGAACGGAGACGACGCCTTTGCAAGGAGACCCACGGTTGGTGCTCAAATACCAGAGAAG 159 ATCCAAAAGGCCTTCGATGATATTGCCAAATACTTCTCTAAGGAAGAGGTGGGAAAAAGATG Gaps marker; antigen; diagnosis; serological fishing; human; 0 Length 931; Sequence 931 BP; 274 A; 207 C; 231 G; 219 T; 0 U; 0 Other; Indels 86.2%; Score 496.6; DB 2; llarity 91.5%; Pred. ne present in the method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in coprastion of at least one gene (1) of a signature gene set, where (1) comprises a sequence (S) selected from 8447 sequences (given in ABL66664 comprises a sequence (S) selected from 8447 sequences (given in ABL66664 comprises a sequence (S) selected from 8447 sequences (given in ABL66664 comprises indicative of anti-neoplastic activity. (I) has ofvostatic cartivity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is confirmed the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, appillary carcinoma and Wilm's cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present invention describes a method (M1) for screening for an anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent comprises of the for anti-neoplastic activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in air least 95% identical to (S), where a change in comprises in indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is anti-neoplastic agent. M1 can be used in the treatment of cancer such the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such the convertient of the agent. M2 cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarionema, carcinoma, clear cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                       Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        craderricaaddecaccerceacerricarergramaaacaddecaaagaerricaag 338

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (III). (II) are useful for treating disorders involving aberrant protein expression or biological activity. The

polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                  09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           481 AAACAIGCCIGGACCCACAGACTGCGIGAGAAAGCAGCIGG--IGGITIAIGAAGAGA

Patent No. 5698396
GENERAL INFORMATION:
APPLICANT: Pfreundschuh, Michael
TITLE OF INVENTION: Method For Identifying Or Isolating A Molecule
TITLE OF INVENTION: And Molecules Identified Thereby
NUMBER OF SEQUENCES: 3
CORRESPONDENCE ADDRESS:
ADDRESSEE: Felfe & Lynch
STREET: 805 Third Avenue
CITY: New York City
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             kb storage
